

Government Application

A gateway to segregate the LAN email from smartphone e-mail

Government enterprises can utilise janusGATE Mobile to operate as a transfer Cross Domain Solution (CDS) to provide distinct security domains for the e-mail within the enterprise's LAN (high) and the e-mail on the smartphone network (low).

In general, the security rating of a network is the security rating of the lowest rated device connected to the network. If a smart phone is considered to have a security rating of IN-CONFIDENCE and it is to synchronise with an Exchange server on a network with a PROTECTED rating, janusGATE Mobile can control the e-mail flow from the e-mail server to the smartphones. Specifically, it can detect messages with a security classification higher than the security rating of the smart phone. Those messages (with a high security classification) are not delivered to, and most importantly not stored on the smartphone.

Using janusGATE Mobile to separate mobile and LAN e-mail security domains

If necessary, mobile access to sensitive information can be provided by Microsoft Outlook Web Access (OWA), which can be configured so that no attachments are available to browsers. This minimises the amount of information that can be stored on the smart phone. In this fashion, janusGATE Mobile notifies the recipient that a sensitive message is available using the smart phone's native e-mail client, and Outlook Web Access provides secure access to the message. The smartphone user accesses messages of low sensitivity using the smartphone's native e-mail client.

janusGATE Mobile can also detect and redact sensitive numeric identifiers, such as social security numbers and taxation file numbers. This reduces the security risk to the enterprise so that private and sensitive information is not accidentally delivered to, and stored on the smart phone.

Evaluate

To evaluate, go to janusNET's evaluation page: www.janusnet.com/evaluate, or send an email to mobile@janusnet.com.

About janusNET

janusNET was founded in 2004 following 11 years of research, development and innovative thinking around security for electronic information.

janusNET develop solutions and manufacture products for companies to enforce security classification policies.

janusNET solutions are deployed globally to both government and private enterprise.

janusNET also support a wide range of desktop productivity tools, with the ability to integrate into other information systems.
